PRODUCT REVIEW

Agentic Employee Records

AI-governed compliance and evidence automation for high-churn, labor-heavy workforces.

Recommendation: validate further with 2–5 paid design partners before committing to full-scale build.

Presented by
Sreenivas Vinnakota | AI Product Manager

The problem is not storage - it is defensibility at workforce speed

High-churn industries have large employee-record volumes, frequent expiries and real audit exposure.

Documents / records most likely to be missing, expired or unverifiable

Healthcare / care delivery	Manufacturing / logistics
Licenses, CPR/BLS certifications, immunization clearance, background checks, training attestations	I-9 supporting docs, OSHA / safety training, forklift certifications, union / contract acknowledgements

BPO / customer support	Staffing / gig / hourly
Offer letters, NDA / security policy, remote-work acknowledgement, equipment return, shift policy sign-off	Right-to-work docs, assignment letters, tax forms, customer-site credentials, role-specific expiries

Cost of the pain for HR

$288–$2,861
I-9 paperwork fine per violation (2025/26 public guidance).

$149K
Median annual US HR manager wage — manual review is expensive expert time.

Weeks
Audit prep/rework when evidence, rule and owner are not linked.

Budget impact: HR pays twice - first in manual review hours, then again in remediation, legal review and audit response when evidence cannot be defended.

Market framing: TAM, SAM, SOM

TAM: $5.9B
Global document management software market, 2024.

SAM: $0.6–1.0B
US HR document + workforce compliance automation wedge, modeled.

SOM: $10–20M
3-year ARR from existing B2B relationships + HCM marketplace wedge.

Assumptions to validate

1. Buyers value defensibility over another document vault.
2. Initial wedge is high-churn US employers with audit exposure.
3. HCM remains system of record; we complement, not replace.
4. Two to three painful document types create enough paid urgency.

Note: if we cannot prove measurable audit-readiness value in a narrow wedge, this becomes a feature — not a company-level product bet.

Source basis: USCIS/ICE I-9 fine schedules via legal summaries; BLS HR manager wage; market sizing from document-management market reports.

Personas - three trust thresholds to satisfy

The user needs speed, the admin needs control, and the buyer needs risk/budget evidence.

PRIMARY USER

Maya

HR Operations Manager

Runs the daily file-completeness queue, employee follow-ups, audit pulls and exception handling.

RECORDS HANDLED

8K–12K active files; 80–150 open gaps/week

EXISTING COST

2–3 FTE/month in document chasing and review.

COST OF ERROR / DELAY

Onboarding delay, audit rework, employee frustration.

PAIN POINTS IN SEVERITY ORDER

- Critical: manual search across HCM, SharePoint, email
- High: cannot defend why a gap was flagged
- High: repetitive follow-up loops
- Medium: no SLA / aging view for gaps

GOVERNANCE USER

Priya

HR Compliance Admin

Owns policy rules, document types, confidence thresholds, approvals and rule-version governance.

RECORDS HANDLED

40K+ records across entities, states and worker types

EXISTING COST

1–2 weeks to update, test and communicate policy changes.

COST OF ERROR / DELAY

Wrong rule version creates repeat findings and re-audit cost.

PAIN POINTS IN SEVERITY ORDER

- Critical: no replay test before rule changes
- High: no versioned rule attached to findings
- High: low-confidence docs lack routing logic
- Medium: weak author / approver split

BUYER PERSONA

David

VP HR / CHRO

Funds HR transformation and answers to Legal, Finance and Audit for people-process risk.

RECORDS HANDLED

10K–50K+ files; high onboarding/offboarding volume

EXISTING COST

Manual audits and remediation can consume six-figure annual budget.

COST OF ERROR / DELAY

Regulatory exposure, litigation support cost, brand risk.

PAIN POINTS IN SEVERITY ORDER

- Critical: cannot quantify compliance exposure
- High: audit prep takes weeks, not days
- High: HCM still leaves repository blind spots
- Medium: AI pilots lack ROI / controls

The market has tools - but not a governed employee-file agent layer

HCM and document vendors cover records and workflow. The open wedge is explainable, governed AI remediation across repositories.

Player set	Key capabilities already visible	What is still missing	Implication
Workday · SAP SuccessFactors · Oracle HCM	System of record, employee workflows, document objects, role permissions; Workday has announced HR AI agents and agent management.	Often HCM-object centric; limited cross-repository evidence proof + policy version + remediation trail.	Complement, do not replace.
Kainos EDM · aconso · WorkDocs / MetaSource	HCM-connected employee document management, generation, lifecycle, classification, e-sign, audit-proof storage.	Strong document ops; less visible agent governance: “why”, replay evals, approval gates, risk analytics.	Partner or compete with AI layer.
Darwinbox · Keka · Rippling · Ceipal · BambooHR	Mid-market HRMS, onboarding, document capture, APIs / marketplaces and workflow automation.	Good workflow surfaces; need deeper file-risk analytics and audit packet generation.	Marketplace / integration GTM.
DocuSign · OpenText · SharePoint · Box	E-signature, retention, content search, repository controls and audit trails.	They store evidence but lack HR policy context and employee-specific remediation.	Integrate as evidence sources.

Most relevant wedge: governed compliance automation with proof-before-action - not AI search alone.

5–10 year workforce thesis: healthcare and social assistance is projected by BLS to add the most jobs; frontline services, logistics and tech-enabled operations will create high-volume file-risk.

Source basis: Workday Illuminate / Agent System of Record announcements; Kainos EDM public pages; aconso digital personnel file; vendor public pages; BLS 2025–2035 employment projections.

User journey - where adoption is won or lost

The decisive moment is not detection; it is when HR asks "why?" and gets evidence, policy source and confidence in one place.

	Awareness	First use	Trust — decision	Habit	Advocacy
GOAL	Know why this is not another file vault.	Resolve one gap without learning a new system.	Defend the AI finding before action.	Clear gaps weekly with fewer touches.	Expand to more states / docs.
ACTIONS	Sees audit-readiness score and priority queue.	Opens employee; reviews gap and sources checked.	Clicks "Why?"; verifies rule version + evidence.	Approves AI remediation; tracks SLA.	Shows audit packet and risk reduction.
PAIN POINTS	"We already store files in HRMS."	Does not trust classification or source mapping.	The finding is useless unless evidence is visible.	Needs exception handling and low-confidence routing.	Needs ROI: less rework, faster audit prep.
CONFIDENCE	**2/5**	**3/5**	**3/5**	**4/5**	**5/5**

If the "why" moment is weak, HR treats the agent as another alert queue — not as a trusted workflow. This is the prototype moment I would over-invest in.

Solution approach (MVP) - agents that explain before they act

Build a narrow, governed AI workflow: detect employee-record gaps, explain the evidence, draft remediation, and prove closure.

1 Ingestion Agent
Connects to HCM + repositories; classifies docs; maps evidence to employees.

→

2 Compliance Agent
Checks file completeness against policy; flags gaps, severity, confidence and rule version.

→

3 Remediation Agent
Drafts tasks/messages; routes approvals; tracks SLA and escalation.

→

4 Audit & Retrieval Agent
Answers “why”; builds audit packet with source links and action history.

How agents are invoked via UX

- Priority queue: “Review critical I-9 gap”
- Employee dossier: “Why was this flagged?”
- Evidence drawer: “Open source / confirm finding”
- Remediation task: “Approve & send”
- Copilot: “Show files likely to fail audit”

Value for HR Operations

- Less time hunting for evidence
- Fewer blind compliance alerts
- One-click explanation: requirement, source, confidence
- Human approval before employee outreach
- Audit packet generated from the workflow

How the workflow is built

A deterministic workflow orchestrates bounded agents: trigger → retrieve evidence → classify → apply rule → create finding → require approval → remediate → verify → close. The agent is not free-form; each step has inputs, outputs and audit events.

Admin configuration & governance: agent onboarding wizard, capability manifest, document-type rules, thresholds, policy versions, RBAC, author/approver split, replay evals before publish, observability logs, guardrails for low confidence / PII / external communication.

Admin analytics dashboard: file completeness, critical gaps, false positives, “Why?” drill-down, confirmation/dismissal rate, median resolution time, rule version impact, agent failures and SLA breaches by business unit / document type.

AI can recommend and prepare work; HR remains accountable for confirmation, communication and closure.

Roadmap - earn trust first, then expand autonomy

MVP scope is narrow by design: prove governed remediation on a few painful employee-record gaps before broad rollout.

MVP (Alpha) · 0–3 months

MUST-HAVE CAPABILITIES

- HCM + SharePoint/Box + DocuSign connectors
- Employee dossier + file health score
- Ingestion, Compliance, Remediation, Audit agents
- I-9 / signed policy / certification gap detection
- “Why flagged?” evidence drawer + confidence
- Human approval gates + audit trail

DELIBERATELY POSTPONED

- No global regulatory library
- No full retention engine
- No autonomous employee outreach

Phase 1 (Beta) · 4–8 months

MUST-HAVE CAPABILITIES

- Admin configuration page
- Agent onboarding wizard + capability manifest
- Bounded rules, thresholds, versions
- Replay evals before publish
- Observability: traces, failures, latency, overrides
- Pilot analytics + Mixpanel funnel

DELIBERATELY POSTPONED

- No free-text prompts controlling agents
- No auto-close without HR confirmation
- No complex case management

Phase 2 (GA) · 9–12 months

MUST-HAVE CAPABILITIES

- Marketplace packaging for HCM / HRMS
- More document types + state-specific rules
- Audit packet export + auditor view
- Bulk remediation and escalations
- Security hardening + SOC2 path
- Commercial packaging + partner onboarding

DELIBERATELY POSTPONED

- No full autonomous closure
- No outcome pricing until measured
- No multi-country compliance in year 1

Integrations to prioritize: 1) HCM APIs 2) SharePoint/Box/Drive 3) DocuSign/Adobe Sign 4) Email archive 5) Ticketing/workflow. Rationale: maximize repeat HR work + audit exposure before expanding autonomy.

Validation plan - earn the right to invest, then scale

Before major engineering spend, test problem intensity, willingness to pay, PMF signals and add/replace/buy behavior.

Customer problem

- 20–30 HR/compliance interviews in high-churn sectors
- Shadow 5 file-review workflows
- Baseline gap volume, audit prep time and rework

Willingness to pay

- Paid design-partner LOIs
- Price against monitored employees + admin entitlement
- Test $25K–$75K pilot range

PMF signals

- ≥70% “very disappointed” without it
- ≥50% reduction in time to resolve top gaps
- Weekly repeat use by HR ops

Buy / add / replace

- Confirm complement vs replace HRMS/document stack
- Budget owner + security path known
- Bought as compliance layer, not generic vault

GO / PIVOT / STOP evidence

GO
2–5 paid pilots, clear ROI baseline, HR users trust “why”, security path unblocked.

PIVOT
Problem is real but wedge shifts — e.g., certifications or onboarding docs beat I-9.

STOP
Buyers will not pay, HR does not trust AI, or HCM/document vendors already satisfy pain.

First 12 months sequence

Discovery → Validation → MVP → Pilot → First customers → Scale

Milestones measured: validated pain → paid intent → working MVP → repeat usage → procurement onboarding path → repeatable GTM motion.

Commercial model and metrics - price coverage, measure trust

Do not tax the remediation behavior we want. Price the monitored population; instrument the trust moments.

Revenue model: Phase 1

1. **Platform entitlement**
   Paid add-on on existing tenant; includes connectors and admin controls.
2. **Monitored employee bands**
   Tiers based on active employee records; scales with exposure.
3. **Implementation / policy pack**
   One-time setup for connectors, rule mapping and audit baseline.
4. **Future outcome pricing**
   Only after Phase 2 can measure compliance lift / reduced prep time.

Trust
Why drill-down rate
Confirmation / dismissal
Override reasons

Efficiency
Median resolution time
HR touches per issue
Auto-classified docs

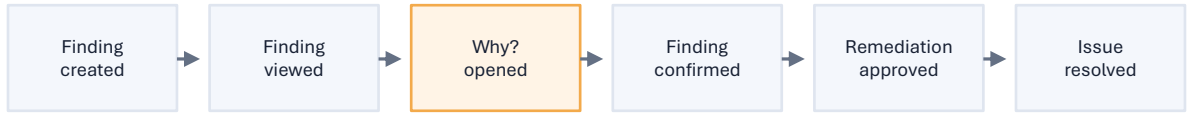

Quality
Classification accuracy
False positive / negative
Rule correction rate

Adoption
Weekly active HR users
Dossiers reviewed
Copilot queries / user

North Star: Verified complete employee files within policy SLA

Moves only when files are complete, explainable and closed within governance rules — not just when AI flags more items.

Mixpanel funnel to instrument

Admin dashboard should trend these by business unit, document type, rule version and agent version.

Product strategy - win the trust wedge, then expand file coverage

I would not start with every compliance gap. I would start where file gaps are painful, repeatable and provable.

Customer job	Maintain complete employee files, pass audits, onboard/offboard fast, answer “why” under pressure.
Pain	Fragmented evidence, manual rule interpretation, untrusted AI, delayed remediation, audit prep rework.
Gains	Audit-ready packet in minutes, lower HR touches, fewer critical gaps, measurable compliance posture.
Product value	Continuously monitors file health, explains gaps with evidence, drafts remediation, records every action.

Product-market fit definition

Usage	Trust	Efficiency	Expansion
≥60% of HR ops users active weekly in pilot	≥70% finding confirmation; low blind approval bias	≥30% reduction in time to resolve top gaps	Buyer requests more docs / entities after pilot

Differentiator: explainability is not a feature tab - it is the adoption mechanism that lets HR approve the agent’s next action.

GTM for the first 20 customers - pilots first, then distribution

Start with controlled pilots in high-volume HR operations; distribute through HCM/HRMS ecosystems once evidence is credible.

Initial ICP: US employers with 2K–25K workers, high churn, regulated onboarding and frequent document changes — healthcare, staffing, BPO/support, manufacturing/logistics.

Buyer: VP HR / CHRO + HR Ops + Compliance owner. Budget: HR transformation, compliance automation, or operational efficiency.

1–5 **Pilot customers**

Onboard 2–5 design partners from existing B2B relationships. Co-configure 2–3 document types and measure baseline.

6–10 **Upsell existing customers**

Target accounts already using workflow/content/document solutions; sell compliance add-on with pilot credit.

11–15 **Large HCM marketplaces**

Package connectors and marketplace listing for Workday, SAP SuccessFactors, Oracle HCM, UKG.

16–20 **Mid-market HRMS partners**

Partner with Darwinbox, Keka, Rippling, Ceipal, BambooHR/Gusto-style vendors needing deeper compliance packs.

PM recommendation to CEO — Validate further

1. Pain is real, but paid urgency must be proven by sector and document type.
2. HCMs own the core record; our wedge must be governed compliance, not another repository.
3. Start with 2–5 paid pilots; no 12-month build until the “why” moment earns trust.
4. Admin governance, evals, observability and human approval are non-negotiable for enterprise adoption.
5. Proceed to Phase 1 only if pilots show faster resolution, accepted findings and expansion demand.
